Kinematics vs dynamics

- ▶ **Kinematics**: the branch of mechanics that studies the motion of a body or system without consideration for its mass or forces acting on it:
 - ▶ **geometry of motion**
 - ▶ Omniscient observer that puts all object into motion **instantaneously**
 - ▶ **massless** and **forceless**
 - ▶ No consideration for **past** history of all other objects in the universe
 - ▶ displacement/position, velocity and acceleration

Kinematics vs dynamics

- ▶ **Kinematics:** the branch of mechanics that studies the motion of a body or system without consideration for its mass or forces acting on it:
 - ▶ **geometry of motion**
 - ▶ Omniscient observer that puts all object into motion **instantaneously**
 - ▶ **massless** and **forceless**
 - ▶ No consideration for **past** history of all other objects in the universe
 - ▶ displacement/position, velocity and acceleration
- ▶ **Dynamics:** Behaviour of an object/system subjected to forces

Kinematic equations of motion

Kinematic equations of motion

- ▶ Variables: (u , v , s , t , a)
 - ▶ s =distance
 - ▶ v =velocity
 - ▶ u =initial velocity
 - ▶ a =acceleration
 - ▶ t =time
- ▶ Four equations:
 - ▶ $s = t(u + v)/2$
 - ▶ $v = u + at$
 - ▶ $s = ut + (1/2)at^2$
 - ▶ $v^2 = u^2 + 2as$
- ▶ **Important:** valid for constant acceleration

Applications

- ▶ Particle trajectories (under constant acceleration)
- ▶ Robotics
- ▶ Character kinematics

Question: what if acceleration isn't constant?

Question: what if acceleration isn't constant?

Answer: **dynamic** equations of motions are considered
(forces)

Kinematic

Hierarchies
and Degrees
of Freedom

Forward
Kinematics

Inverse
Kinematics

Summary

- 1 Kinematic
- 2 Hierarchies and Degrees of Freedom**
- 3 Forward Kinematics
- 4 Inverse Kinematics
- 5 Summary

Hierarchies

- ▶ Common ways of representing *chained* mechanical systems: robots, humans, creatures
- ▶ Human representation:
 - ▶ bones are **directional**
 - ▶ root: usually hips or **pelvis**
- ▶ Control: interesting usability question
 - ▶ Usable by programmers (API)
 - ▶ Usable by Technical Director (higher-level tool)
 - ▶ Usable by animator (rig)

Degrees of freedom

- ▶ Number of independent variables required to describe motion:

Degrees of freedom

- ▶ Number of independent variables required to describe motion:
- ▶ up to 3 translations

Degrees of freedom

- ▶ Number of independent variables required to describe motion:
- ▶ up to 3 translations
- ▶ up to 3 rotations

Degrees of freedom

Revolute

Prismatic

Cylindrical

Planar

Screw

Spherical

- ▶ Number of independent variables required to describe motion:
- ▶ up to 3 translations
- ▶ up to 3 rotations

Degrees of freedom

Revolute

Prismatic

Cylindrical

Planar

Screw

Spherical

- ▶ Number of independent variables required to describe motion:
- ▶ up to 3 translations
- ▶ up to 3 rotations
- ▶ For most mechanical systems:

Degrees of freedom

- ▶ Number of independent variables required to describe motion:
- ▶ up to 3 translations
- ▶ up to 3 rotations
- ▶ For most mechanical systems:
 - ▶ Limited number of DoF
 - ▶ limited range

Degrees of freedom

- ▶ Number of independent variables required to describe motion:
- ▶ up to 3 translations
- ▶ up to 3 rotations
- ▶ For most mechanical systems:
 - ▶ Limited number of DoF
 - ▶ limited range
 - ▶ singularities!

Forward Kinematics: General problem

Find f such that:

$$p = f(\theta)$$

where:

p is the position of the end effector.

$$\theta = (\theta_1, \theta_2, \dots, \theta_n)$$

Two joint chain

Two joint chain

► P1:

$$P_{x_1} = L_1 \cdot \cos(\theta_1)$$

$$P_{y_1} = L_1 \cdot \sin(\theta_1)$$

Two joint chain

► P1:

$$P_{x_1} = L_1 \cdot \cos(\theta_1)$$

$$P_{y_1} = L_1 \cdot \sin(\theta_1)$$

► P2:

$$P_{x_2} = P_{x_1} + L_2 \cdot \cos(\theta_1 + \theta_2)$$

$$P_{y_2} = P_{y_1} + L_2 \cdot \sin(\theta_1 + \theta_2)$$

Two joint chain

► P1:

$$P_{x_1} = L_1 \cdot \cos(\theta_1)$$

$$P_{y_1} = L_1 \cdot \sin(\theta_1)$$

► P2:

$$P_{x_2} = P_{x_1} + L_2 \cdot \cos(\theta_1 + \theta_2)$$

$$P_{y_2} = P_{y_1} + L_2 \cdot \sin(\theta_1 + \theta_2)$$

► P2 (expanded):

$$P_{x_2} = L_1 \cdot \cos(\theta_1) + L_2 \cdot \cos(\theta_1 + \theta_2)$$

$$P_{y_2} = L_1 \cdot \sin(\theta_1) + L_2 \cdot \sin(\theta_1 + \theta_2)$$

Two joint chain

► P1:

$$P_{x_1} = L_1 \cdot \cos(\theta_1)$$

$$P_{y_1} = L_1 \cdot \sin(\theta_1)$$

► P2:

$$P_{x_2} = P_{x_1} + L_2 \cdot \cos(\theta_1 + \theta_2)$$

$$P_{y_2} = P_{y_1} + L_2 \cdot \sin(\theta_1 + \theta_2)$$

► P2 (expanded):

$$P_{x_2} = L_1 \cdot \cos(\theta_1) + L_2 \cdot \cos(\theta_1 + \theta_2)$$

$$P_{y_2} = L_1 \cdot \sin(\theta_1) + L_2 \cdot \sin(\theta_1 + \theta_2)$$

► Easily generalisable to n joints

- 3 Forward Kinematics
- 4 Inverse Kinematics**
- 5 Summary

Inverse Kinematics: General problem

Resolve:

$$\theta = f^{-1}(p)$$

where:

p is the position of the end effector.

$$\theta = (\theta_1, \theta_2, \dots, \theta_n)$$

IK solving techniques

- ▶ **Closed form solutions:** can be expressed analytically i.e., algebraically or geometrically.
 - ▶ only possible/practical in simple scenarios
 - ▶ systems with revolute and prismatic joints with up to 6 DoF solvable.
 - ▶ there isn't always one and one unique solution

IK solving techniques

- ▶ **Closed form solutions:** can be expressed analytically i.e., algebraically or geometrically.
 - ▶ only possible/practical in simple scenarios
 - ▶ systems with revolute and prismatic joints with up to 6 DoF solvable.
 - ▶ there isn't always one and one unique solution
- ▶ **Numerical solutions:** finds the solution iteratively by minimising the distance to a target.
 - ▶ Cyclic Coordinate Descent (CCD)
 - ▶ Jacobian Transpose
 - ▶ Levenberg-Marquardt Damped Least Squares (DLS)
 - ▶ Neural net and AI

Analytical solution (geometric)

Two joint chain, one DoF

$p : (x, y)$

Analytical solution (geometric)

Two joint chain, one DoF

$p : (x, y)$

$$\theta_2 = \text{acos} \left(\frac{l_1^2 + l_2^2 - (x^2 + y^2)}{2l_1 l_2} \right)$$

Analytical solution (geometric)

Two joint chain, one DoF

$p : (x, y)$

$$\theta_2 = \text{acos} \left(\frac{l_1^2 + l_2^2 - (x^2 + y^2)}{2l_1 l_2} \right)$$

$$\theta_1 = \text{atan} \left(\frac{x(l_2 \cos(\theta_2) + l_1) - y l_2 \sin(\theta_2)}{y(l_2 \cos(\theta_2) + l_1) - x l_2 \sin(\theta_2)} \right)$$

Intuitive algorithm?

Intuitive algorithm?

Cyclic Coordinate Descent

Cyclic Coordinate Descent

- ▶ solve 1 DoF problem recursively.

Cyclic Coordinate Descent

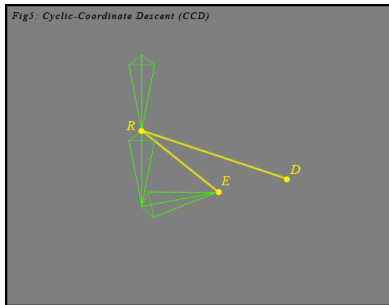

- solve 1 DoF problem recursively.
- **Example 1:** 3 link chain resolution

Cyclic Coordinate Descent

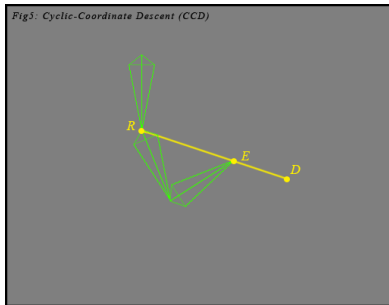

- solve 1 DoF problem recursively.
- **Example 1:** 3 link chain resolution

- ▶ solve 1 DoF problem recursively.
- ▶ **Example 1:** 3 link chain resolution

Cyclic Coordinate Descent

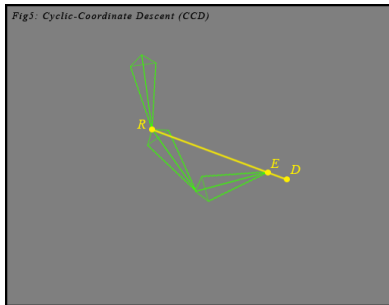

- solve 1 DoF problem recursively.
- **Example 1:** 3 link chain resolution
- **Example 2:** 4 link chain resolution

CCD - Strengths and weaknesses

- ▶ + simple to implement
- ▶ + computationally cheap
- ▶ + scalable
- ▶ - biased towards end of chain rotations
- ▶ - may lead to odd solutions

CCD - Optimisation/modification

- ▶ Optimisation ideas:
 - ▶ Restricting DoF
 - ▶ Damping (limit the range of rotation of joints)
 - ▶ Overshooting the target
- ▶ Extension ideas: later in the lecture ...

Jacobian technique

What is a Jacobian?

- Mapping from velocities in **joint space** to velocities in **Cartesian space**.

What is a Jacobian?

- ▶ Mapping from velocities in **joint space** to velocities in **Cartesian space**.
- ▶ A linear approximation of $f()$

What is a Jacobian?

- ▶ Mapping from velocities in **joint space** to velocities in **Cartesian space**.
- ▶ A linear approximation of $f()$
- ▶ Defines how the end effector p changes relative to instantaneous changes in the system with regards to θ .

What is a Jacobian?

Mathematically:

$$J = \frac{dp}{d\theta}$$

$$J = \begin{pmatrix} \frac{\partial p_x}{\partial \theta_1} & \frac{\partial p_x}{\partial \theta_2} & \cdots & \frac{\partial p_x}{\partial \theta_m} \\ \frac{\partial p_y}{\partial \theta_1} & \frac{\partial p_y}{\partial \theta_2} & \cdots & \frac{\partial p_y}{\partial \theta_m} \\ \frac{\partial p_z}{\partial \theta_1} & \frac{\partial p_z}{\partial \theta_2} & \cdots & \frac{\partial p_z}{\partial \theta_m} \end{pmatrix}$$

What is a Jacobian?

We can therefore approximate small variations $\Delta\theta$ with:

$$J = \frac{dp}{d\theta} \approx \frac{\Delta p}{\Delta\theta}$$

What is a Jacobian?

We can therefore approximate small variations $\Delta\theta$ with:

$$J = \frac{dp}{d\theta} \approx \frac{\Delta p}{\Delta\theta}$$

$$J.\Delta\theta = \Delta p$$

What is a Jacobian?

We can therefore approximate small variations $\Delta\theta$ with:

$$J = \frac{dp}{d\theta} \approx \frac{\Delta p}{\Delta\theta}$$

$$J \cdot \Delta\theta = \Delta p$$

$$\Delta\theta = J^{-1} \Delta p$$

1 Jacobian must be computed

- ▶ Analytically
- ▶ Numerically

Next steps

- 1 Jacobian must be computed
 - ▶ Analytically
 - ▶ Numerically
- 2 Jacobian must be inverted
 - ▶ Not easy!

Next steps

Cyclic Coordinate
Descent

Jacobian technique

Summary

- For a rotational joint, the linear change in the end effector is the cross product of the axis of revolution and a vector from the joint to the end effector

$$\frac{\partial p}{\partial \theta_i} = \left[\frac{\partial p_x}{\partial \theta_i}, \frac{\partial p_y}{\partial \theta_i}, \frac{\partial p_z}{\partial \theta_i} \right]^T = \vec{a}_i \times \vec{q}_i$$

2. Inverting the Jacobian

- ▶ J may not be square and/or invertible

2. Inverting the Jacobian

- ▶ J may not be square and/or invertible
- ▶ Classic solutions:

2. Inverting the Jacobian

- ▶ J may not be square and/or invertible
- ▶ Classic solutions:
 - ▶ Jacobian Transpose
Faster, but less efficient

2. Inverting the Jacobian

- ▶ J may not be square and/or invertible
- ▶ Classic solutions:
 - ▶ Jacobian Transpose
Faster, but less efficient
 - ▶ Pseudo-inverse (Moore-Penrose Inverse)

2. Inverting the Jacobian

- ▶ J may not be square and/or invertible
- ▶ Classic solutions:
 - ▶ Jacobian Transpose
Faster, but less efficient
 - ▶ Pseudo-inverse (Moore-Penrose Inverse)
 - ▶ Singular Value Decomposition (SDV)

2. Inverting the Jacobian

- ▶ J may not be square and/or invertible
- ▶ Classic solutions:
 - ▶ Jacobian Transpose
Faster, but less efficient
 - ▶ Pseudo-inverse (Moore-Penrose Inverse)
 - ▶ Singular Value Decomposition (SDV)
 - ▶ Damped Least Squares (DLS)

2. Inverting the Jacobian

- ▶ Classic solutions:
 - ▶ Jacobian Transpose
Faster, but less efficient
 - ▶ Pseudo-inverse (Moore-Penrose Inverse)
 - ▶ Singular Value Decomposition (SDV)
 - ▶ Damped Least Squares (DLS)
 - ▶ Pseudoinverse DLS

2. Inverting the Jacobian - Transpose

$$\Delta\theta = J^{-1} \Delta p$$

approximated by

$$\Delta\theta = \alpha J^T \Delta\vec{e}$$

Where:

\vec{e} desired change of effector

$$\alpha = \frac{\vec{e} \dot{J} J^T \vec{e}}{J J^T \vec{e} \dot{J} J^T \vec{e}}$$

2. Inverting the Jacobian - Pseudo-inverse

$$\Delta\theta = J^{-1}\Delta p$$

approximated by

$$\Delta\theta = J^\dagger \vec{e}$$

Where:

\vec{e} desired change of effector

$$J^\dagger = (J^T J)^{-1} J^T$$

```
while dp is larger than tolerance{  
    dp = p - pTarget  
    compute J  
    compute J* = approximation of inv(J)  
    compute dAngle = J* dX  
    Angle = Angle + dAngle // update joint angle  
    compute new p  
}
```
